

含双参数的非线性二阶脉冲微分系统的正解

蔡静静

(同济大学 数学系, 上海 200092)

摘要: 研究一类带有双参数的非线性二阶 m 点脉冲微分系统正解的存在性并讨论正解不存在的情况, 其中非线性项可有不同性质, 系数 $a_1(t)$ 和 $a_2(t)$ 均 L^p 可积. 通过构造一个特殊的锥, 结合不动点指数理论, 得到了参数 λ 和 μ 在不同条件下正解存在性定理, 并在 λ 很小时得到了正解不存在性定理.

Positive Solutions for Nonlinear Second Order Impulsive Differential Systems with Two Parameters

CAI Jingjing

(Department of Mathematics, Tongji University, Shanghai 200092, China)

Abstract: The paper presents a study of the existence of positive solutions for a class of nonlinear second order impulsive differential systems with two parameters and the nonexistence of positive solutions, where the nonlinear terms have different properties and their coefficients $a_1(t), a_2(t)$ are L^p -integrable. By applying the theory of the fixed point index and constructing a special cone, the existence theorem of positive solutions is proved when parameters λ and μ have different conditions, and the nonexistence theorem of positive solutions is proved while λ is sufficiently small.

Key words: positive solution; boundary value problem; fixed point index; cone

1 引言

本文研究下面二阶 m 点脉冲微分系统正解的存在性

$$\begin{cases} \lambda x'' + a_1(t)f_1(t,x,y) + b_1(t) \\ g_1(t,x,y) = 0, \quad 0 < t < 1, \\ \mu y'' + a_2(t)f_2(t,x,y) + b_2(t) \\ g_2(t,x,y) = 0, \quad 0 < t < 1, \\ -\Delta x' \Big|_{t=t_k} = I_{1,k}(x(t_k)), \\ -\Delta y' \Big|_{t=t_k} = I_{2,k}(y(t_k)), \quad k = 1, 2, \dots, n, \\ a_1 x(0) - b_1 x'(0) = \sum_{i=1}^{m-2} p_i^{(1)} x(\xi_i), \\ c_1 x(1) + d_1 x'(1) = \sum_{i=1}^{m-2} q_i^{(1)} x(\xi_i), \\ a_2 y(0) - b_2 y'(0) = \sum_{i=1}^{m-2} p_i^{(2)} y(\xi_i), \\ c_2 y(1) + d_2 y'(1) = \sum_{i=1}^{m-2} q_i^{(2)} y(\xi_i), \end{cases} \quad (1)$$

其中 $\lambda > 0, \mu > 0, a_i > 0, b_i > 0, c_i > 0, d_i > 0, a_i(t), b_i(t) \in L^p[J], 1 \leq p < +\infty, J = [0, 1], \rho_i = a_i c_i + b_i c_i + a_i d_i > 0, \xi_j \in J' = (0, 1), p_j^{(i)}, q_j^{(i)} \in (0, +\infty), i = 1, 2, j = 1, 2, \dots, m-2, f_i, g_i \in C(J \times \mathbf{R}^+ \times \mathbf{R}^+, \mathbf{R}^+), I_{i,k} \in C(\mathbf{R}^+, \mathbf{R}^+).$

微分系统(1)是含有脉冲项的多点边值问题, 它能模拟许多物理现象, 如描述由多个不同性质的部分组成的金属导线横截面的震动情况, 而脉冲描述的是物体在某个时刻有突然变化. 由于其广泛的背景, 这类方程的研究受到广泛重视^[1-4]. 最近, 文献[1]利用不动点定理研究了下面的边值问题正解的存在性:

$$\begin{cases} \lambda x'' + g(t)f(t,x) = 0, \quad 0 < t < 1, \\ ax(0) - bx'(0) = \sum_{i=1}^{m-2} a_i x(\xi_i), \\ cx(1) + dx'(1) = \sum_{i=1}^{m-2} b_i x(\xi_i), \end{cases} \quad (2)$$

作者简介: 蔡静静(1983—), 女, 博士生, 主要研究方向为偏微分方程. E-mail: cijing1983@163.com

其中 $g(t) \in L^p[0,1]$, $f \in C([0,1] \times \mathbf{R}^+, \mathbf{R}^+)$, 笔者在条件“ $f_0 = 0, f_\infty = \infty$, 或者 $f_0 = \infty, f_\infty = 0$ ”下得到问题(2)的正解. 其中 $f_0 = \lim_{u \rightarrow 0^+} \frac{f(u)}{u}$, $f_\infty = \lim_{u \rightarrow \infty} \frac{f(u)}{u}$. 然而不能解决当 λ 变化及函数 x 有跳跃时的情况. 而本文是在参数 λ 及 μ 变化和函数 x 有多个跳跃点时利用不动点指数理论考察系统(1)正解的存在性. 文献[2]得到了下面二阶 m 点边值问题的正解:

$$\begin{cases} -x''(t) = f(t, x(t)), & t \in J, \\ -\Delta x' \Big|_{t=t_k} = I_k(x(t_k)), & k = 1, 2, \dots, n, \\ x(0) = \sum_{i=1}^{m-2} a_i x(\xi_i), \quad x(1) = \sum_{i=1}^{m-2} b_i x(\xi_i). \end{cases} \quad (3)$$

其中 f 连续. 但实际问题中非线性项有时奇异甚至只是 L^p 可积, 此时文献[2]的方法不能解决这类问题. 而本文研究的问题(1)中的非线性项有不同性质且其系数 L^p 可积.

本文的主要思想来源于文献[1-2]等, 并本质改进和推广了其中的结果, 在非线性项有奇异性、函数含有脉冲点及参数可有不同取值范围情况下, 不仅研究了正解存在性也讨论了正解不存在情况.

2 引理及一些结论

空间 $PC^1[0, 1] := \{u \in C[0, 1]: u'(t) \text{ 在 } t \neq t_i \text{ 处连续, 且 } u'(t_i^+) \text{ 和 } u'(t_i^-) \text{ 存在, } u'(t_i) = u'(t_i^-), i = 1, 2, \dots, n\}$ 在范数 $\|x\| = \max\{\|x\|_\infty, \|x'\|_\infty\}$ 下为 Banach 空间. 定义 $PC^1[0, 1] \times PC^1[0, 1]$ 中范数 $\|(x, y)\|_2 = \|x\| + \|y\|$. 本文作以下记号

$$\Delta_i = \begin{vmatrix} -\sum_{j=1}^{m-2} p_j^{(i)} \psi_i(\xi_j) & \rho_i - \sum_{j=1}^{m-2} p_j^{(i)} \phi_i(\xi_j) \\ \rho_i - \sum_{j=1}^{m-2} q_j^{(i)} \psi_i(\xi_j) & -\sum_{j=1}^{m-2} q_j^{(i)} \phi_i(\xi_j) \end{vmatrix}$$

其中 $\psi_i(t) = b_i + a_i t$, $\phi_i(t) = c_i + d_i - c_i t$, $t \in J$ 是 $x'' = 0$ 的线性无关解. 对 $i = 1, 2$, 令

$$G_i(t, s) = \frac{1}{\rho_i} \begin{cases} \psi_i(s) \phi_i(t), & 0 \leq s \leq t \leq 1, \\ \psi_i(t) \phi_i(s), & 0 \leq t \leq s \leq 1, \end{cases}$$

易知 $G_i(t, s)$ 有以下性质:

$$\begin{aligned} G_i(t, s) &> 0, 0 < t, s < 1, \\ 0 \leq G_i(t, s) &\leq G_i(s, s), t, s \in J, \end{aligned}$$

$$\begin{aligned} G_i(t, s) &\geq \sigma_i G_i(s, s), \\ \sigma_i &= \min \left\{ \frac{b_i + a_i \theta}{a_i + b_i}, \frac{d_i + c_i \theta}{c_i + d_i} \right\}, \\ t \in J_\theta &= [\theta, 1 - \theta], s \in (0, 1), \end{aligned}$$

其中 $\theta \in \left(0, \min \left\{ \frac{1}{2}, t_1, 1 - t_n \right\}\right)$, 令 $\sigma = \min \{\sigma_1, \sigma_2\}$, 则 $0 < \sigma < 1$. 本文的假设条件如下:

$$(A1) \quad \Delta_i < 0, \rho_i - \sum_{j=1}^{m-2} p_j^{(i)} \phi_i(\xi_j) > 0, \rho_i - \sum_{j=1}^{m-2} q_j^{(i)} \psi_i(\xi_j) > 0.$$

(A2) $f_i, g_i \in C(J \times \mathbf{R}^+ \times \mathbf{R}^+, \mathbf{R}^+)$, $I_{i,k} \in C(\mathbf{R}^+, \mathbf{R}^+)$, $a_i(t), b_i(t)$ 在 J 的任何子区间上不恒为 0, $i = 1, 2, k = 1, 2, \dots, n$. $a_i(t), b_i(t) \in L^p[J, \mathbf{R}^+]$.

本文对 $u, v \in \mathbf{R}, i = 1, 2$ 定义

$$\begin{aligned} f_{i,\mu} &= \liminf_{\|u\| + \|v\| \rightarrow \mu} \min_{t \in [t_1, t_n]} \frac{f_i(t, u, v)}{\|u\| + \|v\|}, \\ I_{i,\mu}(k) &= \liminf_{\|u\| \rightarrow \mu} \min_{t \in [t_1, t_n]} \frac{I_{i,k}(u)}{\|u\|} \\ f_i^\mu &= \limsup_{\|u\| + \|v\| \rightarrow \mu} \max_{t \in [0, 1]} \frac{f_i(t, u, v)}{\|u\| + \|v\|}, \\ I_i^\mu(k) &= \limsup_{\|u\| \rightarrow \mu} \max_{t \in [0, 1]} \frac{I_{i,k}(u)}{\|u\|}. \end{aligned}$$

其中 $\mu = 0$ 或者 $\mu = +\infty$. 用 g 代替以上的 f 得到 $g_{i,\mu}$ 和 g_i^μ 的定义. 记 $F_i(t, x, y) = a_i(t)f_i(t, x, y) + b_i(t)g_i(t, x, y)$ ($i = 1, 2$). 记 2×2 矩阵的行列式 $X = |\mathbf{a}, \mathbf{b}|$, 其中 \mathbf{a}, \mathbf{b} 为 2 维列向量. \mathbf{a}^\top 为 \mathbf{a} 的转置.

$$\begin{aligned} \mathbf{a}_i &= \left(-\sum_{j=1}^{m-2} p_j^{(i)} \xi_j, \rho_i - \sum_{j=1}^{m-2} q_j^{(i)} \xi_j \right)^\top, \\ C_i &= \frac{1}{\Delta_i} |\mathbf{a}_i, \mathbf{e}_i|, D_i = \frac{1}{\Delta_i} |\mathbf{a}_i, \mathbf{b}_i|, \\ \mathbf{b}_i &= \left(\sum_{j=1}^{m-2} p_j^{(i)} \left(\sum_{k=1}^n G_i(\xi_j, t_k) I_{i,k}(x(t_k)) \right), \right. \\ &\quad \left. \sum_{j=1}^{m-2} q_j^{(i)} \left(\sum_{k=1}^n G_i(\xi_j, t_k) I_{i,k}(x(t_k)) \right) \right)^\top, \\ \mathbf{c}_i &= \left(\sum_{j=1}^{m-2} p_j^{(i)} \int_0^1 G_i(\xi_j, t) (a_i(t) + b_i(t)) dt, \right. \\ &\quad \left. \sum_{i=1}^{m-2} q_j^{(i)} \int_0^1 G_i(\xi_j, t) (a_i(t) + b_i(t)) dt \right)^\top, \\ \mathbf{d}_i &= (\rho_i - \sum_{j=1}^{m-2} p_j^{(i)} \phi_i(\xi_j), -\sum_{j=1}^{m-2} q_j^{(i)} \phi_i(\xi_j))^\top, \\ \mathbf{g}_i &= \left(-\sum_{j=1}^{m-2} p_j^{(i)} \psi_i(\xi_j), \rho_i - \sum_{j=1}^{m-2} q_j^{(i)} \psi_i(\xi_j) \right)^\top, \\ \mathbf{e}_i &= \left(\sum_{j=1}^{m-2} p_j^{(i)} \int_0^1 G_i(\xi_j, t) F_i(t, x(t), y(t)) dt, \right. \\ &\quad \left. \sum_{i=1}^{m-2} q_j^{(i)} \int_0^1 G_i(\xi_j, t) F_i(t, x(t), y(t)) dt \right)^\top, \end{aligned}$$

$$\begin{aligned} & \sum_{j=1}^{m-2} q_j^{(i)} \int_0^1 G_i(\xi_j, t) F_i(t, x(t), y(t)) dt \Big)^T, \\ f_i &= \left(\sum_{j=1}^{m-2} p_j^{(i)} \sum_{k=1}^n G_i(\xi_j, t_k), \sum_{j=1}^{m-2} q_j^{(i)} \sum_{k=1}^n G_i(\xi_j, t_k) \right)^T, \\ A_i &= \frac{1}{\Delta_i} |\mathbf{e}_i, \mathbf{d}_i|, B_i = \frac{1}{\Delta_i} |\mathbf{g}_i, \mathbf{e}_i|, \\ \bar{A}_i &= \frac{1}{\Delta_i} |\mathbf{c}_i, \mathbf{d}_i|, \bar{B}_i = \frac{1}{\Delta_i} |\mathbf{g}_i, \mathbf{c}_i|, \\ \bar{C}_i &= \frac{1}{\Delta_i} |\mathbf{a}_i, \mathbf{c}_i|, \bar{D}_i = \frac{1}{\Delta_i} |\mathbf{a}_i, \mathbf{f}_i|. \end{aligned}$$

引理1^[5] 设 K 是实 Banach 空间 E 中的锥, 对 $r>0$ 记 $K_r=\{x\in K: \|x\|<r\}$. 设 $A: \bar{K}_r \rightarrow K$ 全连续, 且当 $x \in \partial K_r$ 时 $Ax \neq x$, 则下面结论成立:

(i) 若 $\|Au\| \leq \|u\|$, $\forall u \in \partial K_r$, 则 $i(A, K_r, K)=1$; (ii) 若 $\|Au\| \geq \|u\|$, $\forall u \in \partial K_r$, 则 $i(A, K_r, K)=0$. 构造锥 K 为: $K=\{x \in \text{PC}^1[0, 1]: x(t) \geq 0, x \geq \sigma \|x\|, t \in J_\theta\}$. 且定义算子如下:

$$\begin{aligned} A_\lambda(x, y)(t) &= \frac{1}{\lambda} \left[\int_0^1 G_1(t, s) F_1(s, x(s), y(s)) ds + \right. \\ &\quad \left. (A_1 + B_1)\psi_1(t) + (C_1 + D_1)\varphi_1(t) \right] + \\ &\quad \sum_{k=1}^n G_1(t, t_k) I_{1,k}(x(t_k)), \\ B_\mu(x, y)(t) &= \frac{1}{\mu} \left[\int_0^1 G_2(t, s) F_2(s, x(s), y(s)) ds + \right. \\ &\quad \left. (A_2 + B_2)\psi_2(t) + (C_2 + D_2)\varphi_2(t) \right] + \\ &\quad \sum_{k=1}^n G_2(t, t_k) I_{2,k}(x(t_k)). \end{aligned}$$

定义算子 $T: \text{PC}^1[0, 1] \times \text{PC}^1[0, 1] \rightarrow \text{PC}^1[0, 1] \times \text{PC}^1[0, 1]$ 如下: $T(x, y)=(A_\lambda(x, y), B_\mu(x, y))$. 则 BVP(1) 的正解等价于 T 的正的不动点.

引理2 设条件 (A1), (A2) 满足, 则 $T: K \times K \rightarrow K \times K$ 是全连续的.

证明 由条件 (A1), (A2) 知, $A_\lambda(x, y)(s) \geq 0$, $s \in J$ 且对于 $t \in J_\theta$ 有 $x(t) \geq \sigma \|x\|$, 另一方面注意到对于 $t \in J_\theta$, $s \in [0, 1]$, 有 $G(t, s) \geq \sigma G(s, s)$, $\psi(t) \geq \sigma \psi(s)$, 故由 $A_\lambda(x, y), B_\mu(x, y)$ 的定义得 $A_\lambda(x, y)(t) \geq \sigma \|A_\lambda(x, y)\|$, $B_\mu(x, y)(t) \geq \sigma \|B_\mu(x, y)\|$, 从而 $T: K \times K \rightarrow K \times K$. 同文献 [2] 可证明 T 全连续.

3 主要结果

定理1 假设 (A1), (A2) 和 (H1), (H2) 成立, 则

当 μ 和 λ 足够大时 BVP(1) 至少有两个正解.

$$(H1) f_{1,\infty} = g_{2,0} = +\infty;$$

$$(H2) M \sum_{k=1}^n G_i(t_k, t_k) < \frac{1}{2} (i=1, 2).$$

其中 $M = \max_{|u|+|v| \leq 1} \{ |f_i(t, u, v)|, |g_i(t, u, v)|, i=1, 2, k=1, 2, \dots, n \}$.

证明 首先考虑当条件 (A1), (A2), (H1), (H2) 成立时. 令

$$\begin{aligned} \vartheta_i &= (\|G_i\|_q \|a_i + b_i\|_p + (\bar{A}_i + \bar{B}_i) \|\psi_i\| + \\ &\quad (\bar{C}_i + \bar{D}_i) \|\phi_i\|) \left(\frac{1}{2M} - \sum_{k=1}^n G_i(t_k, t_k) \right)^{-1}, \\ \text{且令 } \Omega_1 &= \{(x, y) \in K \times K : \| (x, y) \|_2 \leq 1\}. \text{ 若 } (x, y) \in \partial \Omega_1, \text{ 则 } \| (x, y) \|_2 = \|x\| + \|y\| = 1, \\ &\text{因此对于 } \lambda \in [\vartheta_1, +\infty) \text{ 及 } \mu \in [\vartheta_2, +\infty), \text{ 有} \end{aligned}$$

$$\|A_\lambda(x, y)\| \leq M \left(\frac{1}{\lambda} [\|G_1\|_q \|a_1 + b_1\|_p + \right. \\ &\quad \left. (\bar{A}_1 + \bar{B}_1) \|\psi_1\| + (\bar{C}_1 + \bar{D}_1) \|\phi_1\|] + \right. \\ &\quad \left. \sum_{k=1}^n G_1(t_k, t_k) \right) \leq \frac{1}{2}, \quad (4)$$

同样地, $\|B_\mu(x, y)\| \leq \frac{1}{2}$. 再由式(4)得

$$\|T(x, y)\|_2 = \|A_\lambda(x, y)\| + \|B_\mu(x, y)\| \leq \frac{1}{2} + \frac{1}{2} = 1. \quad (5)$$

即

$$\|T(x, y)\|_2 \leq \| (x, y) \|_2, (x, y) \in \partial \Omega_1 \quad (6)$$

另一方面, 由 $f_{1,\infty} = +\infty$ 知存在 $R_1 > 1$ 使得对于任意的 $|u| + |v| > R_1$ 及 $t \in J_\theta$, 有

$$f_1(t, u, v) \geq \epsilon_2(|u| + |v|)$$

其中 $\epsilon_2 > 0$ 满足

$$\frac{1}{\lambda} \epsilon_2 \sigma \int_\theta^{1-\theta} G_1 \left(\frac{1}{2}, s \right) a_1(s) ds \geq 1 \quad (7)$$

令 $R_2 = \frac{R_1}{\sigma}$ 及 $\Omega_2 = \{(x, y) \in K \times K : \| (x, y) \|_2 < R_2\}$. 另一方面, $x(t) \geq \sigma \|x\| \geq \sigma R_2$, $t \in J_\theta$. 则由式(7)及 T 的定义, 对于任意的 $(x, y) \in \partial \Omega_2$ 有

$$\begin{aligned} \|T(x, y)\|_2 &\geq \left| A_\lambda(x, y) \left(\frac{1}{2} \right) \right| \geq \\ &\geq \frac{1}{\lambda} \sigma \epsilon_2 R_2 \int_\theta^{1-\theta} G_1 \left(\frac{1}{2}, s \right) a_1(s) ds \geq \\ &\geq R_2 = \| (x, y) \|_2 \end{aligned} \quad (8)$$

故

$$T(x, y) \|_2 \geq \| (x, y) \|_2, \forall (x, y) \in \partial\Omega_2 \quad (9)$$

另一方面,由 $g_{2,0} = +\infty$ 知存在 $R_3 > 0$ 且 $R_3 < 1$ 使得对于任意的 $|u| + |v| \leq R_3$ 及 $t \in J_\theta$, 有 $g_2(t, u, v) \geq \epsilon_3(|u| + |v|)$, 其中 $\epsilon_3 > 0$ 满足

$$\frac{1}{\mu} \epsilon_3 \sigma \int_\theta^{1-\theta} G_2\left(\frac{1}{2}, s\right) b_2(s) ds \geq 1 \quad (10)$$

令 $\Omega_3 = \{(x, y) \in K \times K : \| (x, y) \|_2 < R_3\}$, 则对任意的 $(x, y) \in \partial\Omega_3$, 类似于(8)的证明由式(10)知 $\| T(x, y) \|_2 \geq R_3 = \| (x, y) \|_2$. 故

$$\| T(x, y) \|_2 \geq \| (x, y) \|_2, \forall (x, y) \in \partial\Omega_3 \quad (11)$$

由式(6),(9),(11)及引理1知 BVP(1)至少有两个正解 $(x_\lambda^{(1)}, y_\mu^{(1)})$ 和 $(x_\lambda^{(2)}, y_\mu^{(2)})$ 并且 $0 < \| (x_\lambda^{(1)}, y_\mu^{(1)}) \|_2 < 1 < \| (x_\lambda^{(2)}, y_\mu^{(2)}) \|_2$.

注 满足(H1)和(H2)的函数 g_i 很多, 如 $g_i \equiv$ 常数;

定理2 设(A1),(A2)和(H3)成立, 则当 μ 充分大 λ 充分小时 BVP(1)至少有一个正解.

$$(H3) f_{1,\infty} = g_2^0 = +\infty, f_1^0 = g_1^0 = f_2^0 = 0, I_i^0(k) = 0 (i=1,2, k=1,2,\dots,n).$$

证明 由 $f_{1,\infty} = +\infty$ 知存在 $L_1 > 0$ 使得对任意的 $|u| + |v| \geq L_1$ 及 $t \in J_\theta$ 有 $f_1(t, u, v) > 0$, 令 $L > \frac{L_1}{\sigma}$, 则 $m_L = \min_{\sigma L \leq |u| + |v| \leq L, t \in J_\theta} f_1(t, u, v) > 0$, 令 $\Omega_4 = \{(x, y) \in K \times K : \| (x, y) \|_2 \leq L\}$. 则对于 $(x, y) \in \partial\Omega_4$ 及 $\lambda \leq \frac{m_L}{L} \int_\theta^{1-\theta} G_1\left(\frac{1}{2}, s\right) a_1(s) ds$, 类似于(8)的证明有

$$\| T(x, y) \|_2 \geq L = \| (x, y) \|_2 \quad (12)$$

故 $\| T(x, y) \|_2 \geq \| (x, y) \|_2, \forall (x, y) \in \partial\Omega_4$. 另一方面由 $f_1^0 = g_1^0 = 0, I_i^0(k) = 0$ 知, 存在 $0 < l < L$ 和 $\epsilon_0 > 0$ 使得对于任意的 $u, v \in \mathbf{R}^+, |u| + |v| \leq l$ 及 $t \in [0, 1]$ 有

$$\begin{aligned} f_i(t, u, v) &\leq \epsilon_0(|u| + |v|), \\ g_1(t, u, v) &\leq \epsilon_0(|u| + |v|), \\ I_{i,k}(u) &\leq \epsilon_0|u|, i=1,2, k=1,2,\dots,n \end{aligned}$$

令 $\Omega_5 = \{(x, y) \in K \times K : \| (x, y) \|_2 \leq l\}$, 则对于 $(x, y) \in \partial\Omega_5, t \in [0, 1]$ 有

$$\begin{aligned} f_i(t, x(t), y(t)) &\leq \epsilon_0(|x(t)| + |y(t)|) \leq \epsilon_0 l, \\ g_1(t, x(t), y(t)) &\leq \epsilon_0(|x(t)| + |y(t)|) \leq \epsilon_0 l, \\ m_l = \max_{|u| + |v| \leq l, t \in [0, 1]} g_2(t, u, v) &> 0, \end{aligned}$$

$$I_{i,k}(x) \leq \epsilon_0|x(t)| \leq \epsilon_0 l, \quad k=1,2,\dots,n, \quad (13)$$

其中 ϵ_0 满足

$$\epsilon_0 \frac{l}{\lambda} [\| G_1 \|_q \| a_1(s) + b_1(s) \|_p +$$

$$\begin{aligned} &(\bar{A}_1 + \bar{B}_1) \| \psi_1 \| + \\ &(\bar{C}_1 + \bar{D}_1) \| \phi_1 \|] \leq \frac{1}{4}, \\ &\epsilon_0 \sum_{k=1}^n G_1(t_k, t_k) \leq \frac{1}{8}, \\ &i=1,2, \epsilon_0 l \| a_2 \|_p (m_l \| b_2 \|_p)^{-1} \leq 1. \end{aligned} \quad (14)$$

因此由式(14), 对于 $(x, y) \in \partial\Omega_5$ 有

$$\begin{aligned} \| A_\lambda(x, y) \| &\leq \epsilon_0 \frac{l}{\lambda} [\| G_1 \|_q \| a_1(s) + b_1(s) \|_p + \\ &(\bar{A}_1 + \bar{B}_1) \| \psi_1 \| + (\bar{C}_1 + \bar{D}_1) \| \phi_1 \|] + \\ &\epsilon_0 l \sum_{k=1}^n G_1(t_k, t_k) \leq \frac{l}{2} \end{aligned} \quad (15)$$

$$\text{令 } \mu \geq \max \left\{ \frac{6m_l}{l} \| G_2 \|_q \| b_2 \|_p, 8((\bar{A}_2 + \bar{B}_2) \cdot \| \psi_2 \| + (\bar{C}_2 + \bar{D}_2) \| \phi_2 \|) \right\}, \text{ 则对 } (x, y) \in \partial\Omega_5, \text{ 有}$$

$$\| B_\mu(x, y) \| \leq \frac{l}{2} \quad (16)$$

故由式(15)和式(16), 对于任意的 $(x, y) \in \partial\Omega_5$ 得到

$$\begin{aligned} \| T(x, y) \|_2 &= \| (A_\lambda(x, y), B_\mu(x, y)) \|_2, \\ &\leq \frac{l}{2} + \frac{l}{2} = l = \| (x, y) \|_2 \end{aligned} \quad (17)$$

由引理1、式(12)和(17)知 T 有一个不动点 $(x_\lambda, y_\mu) \in \bar{\Omega}_4 \setminus \Omega_5$.

定理3 设(A1),(A2)和下面的 (H^*) 成立, 则当 λ 充分小时 BVP(1)没有正解.

(H^*) 存在 $n(s) \in L[J, R^+]$ 使得 $f_1(s, u, v) \geq n(s)(|u| + |v|), u, v \in \mathbf{R}^+, s \in J_\theta$.

证明 假设 BVP(1) 存在正解 (x, y) , 则 $x, y \in K$, 取 $\lambda < \sigma^2 \int_\theta^{1-\theta} G_1(s, s) a_1(s) n(s) ds$, 则有

$$\begin{aligned} \| (x, y) \|_2 &= \| (A_\lambda(x, y), B_\mu(x, y)) \|_2 \geqslant \\ &\| (A_\lambda(x, y)) \| \geq \frac{\sigma}{\lambda} \int_\theta^{1-\theta} G_1(s, s) a_1(s) \cdot \\ &f_1(s, x(s), y(s)) ds \geq \frac{\sigma^2}{\lambda} \cdot \end{aligned}$$

$$\int_\theta^{1-\theta} G_1(s, s) a_1(s) n(s) ds (\| x \| + \| y \|) >$$

$$\| x \| + \| y \| = \| (x, y) \|_2,$$

这是矛盾的, 因此 BVP(1)没有正解.
